L1 Low Noise Amplifier

Features

- High Rejection Pre-selection Filter
- Excellent Gain
  - G = 40dB
- Low Noise Figure
  - F < 2.0dB

Description

Designed for use with a passive L1 antenna, or for applications in a dense RF signal environment requiring high gain, the L1 LNA features high pre-selection filtering, low noise and 40dB of gain. In order to ensure adequate protection against intermodulation products from out of band signals, the pre-selection filtering precedes the initial amplification stages.

The product may be powered externally with an AC input voltage option, a DC input option, or it may be powered by the GPS receiver's antenna voltage output. Regardless of the input power configuration, the L1 LNA can provide a DC voltage output to power an active GPS antenna. In the case of operation with a passive antenna, the input may be DC blocked.

The L1 LNA amplifier comes with many available options to meet your specific needs. Please call, fax, email (sales@gpssource.com), or visit our website (www.gpssource.com) for further information on product options, specifications, or to receive an easy to use order sheet.

	Powered	Powered, Mil. Conn. or Tinned Leads			Note 2	mA
Max RF Input		Max RF input without damage			10	dBm

Notes:

1. DC IN for powered option must be 2V greater than desired DC Voltage Out
2. Maximum combined DC current draw out all ports of the device is a function of the DC input voltage and desired DC output voltage , according to the following:

$$Iout \leq 1.4 / (V_{DC\,IN} - V_{DC\,OUT}) - 0.007 \quad Amps$$

For powered option with a wall mount transformer (Voltage Input = 110/220/240 VAC), $V_{DC\,IN}$ is 9V.
